REFERENCE DESIGN

SPECIFICATION

Device Series	Application	Input Voltage	Output Power	Topology	I/O Isolation
FAN9673Q, NCV4390DR2G, NCV3843BVD1R2G, FAN3224TUMX_F085, NCV890100PDR2G, NCV51460SN33T1G, NCV210SQT2G, NCV2003SN2T1G, FODM8801C, ...	On Board EV Charger	90 ~ 264 Vac	6.6 kW	3CH Interleave PFC + Full Bridge LLC	Yes

OTHER SPECIFICATION

	Output 1	Output 2
Output Voltage	250 – 450 Vdc	12 Vdc
Ripple	5% (Meet QCT 895 2011)	5%
Max Current	16 A	0.6 A
Min Current	0	0
PFC (Yes/No)	Yes	
Typical Efficiency	94%	
Inrush Limiting	48 A	
Operating Temperature Range	-20 – 85°C	
Cooling Method	Force Air or Liquid cooling: Depends on the Heatsink	
Signal Level Control	On/Off, CC, CV, Bus Voltage	
Dimension	254 x 198 x 70 mm + Heatsink	

Figure 1. Photograph of the Evaluation Board

KEY FEATURES

Whole Solution

- 3CH Interleave PFC to get high efficiency and power density. Decrease the current ripple at mean time
- Full bridge LLC to boost efficiency by high bus voltage usage
- Hardware PFC and LLC control approach for easily designing and less malfunction.
- Active inrush current limit circuit to decrease the PCB footprint
- Full functional solution including input/output current/voltage sensing and CC/CV PWM control interface.
- Bus voltage adjustable to optima the efficiency according to the output voltage.

PFC Controller FAN9673

- Continuous Conduction Mode with Average Current Mode Control
- Three–Channel Interleave Operation
- Programmable Operation Frequency Range: 18 kHz ~ 40 kHz or 55 kHz ~ 75 kHz
- Programmable PFC Output Voltage
- Two Current–Limit Functions
- TriFault Detect Protects Against Feedback Loop Failure
- SAG Protection
- Programmable Soft–Start
- Under–Voltage Lockout (UVLO)
- Differential Current Sensing

LLC Controller NCV4390DR2G(AEC Qualified version of FAN7688)

- Secondary Side PFM Controller for LLC Resonant Converter with Synchronous Rectifier Control
- Charge Current Control for Better Transient Response and Easy Feedback Loop Design
- Adaptive Synchronous Rectification Control with Dual Edge Tracking
- Closed Loop Soft–Start for Monotonic Rising Output
- Wide Operating Frequency (39 kHz ~ 690 kHz)
- Green Functions to Improve Light–Load Efficiency
- Symmetric PWM Control at Light–Load to Limit the Switching Frequency while Reducing Switching Losses
- Protection Functions with Auto–Restart
 - ◆ Over–Current Protection (OCP)
 - ◆ Output Short Protection (OSP)
 - ◆ NON Zero–Voltage Switching Prevention (NZS) by Compensation Cutback (Frequency Shift)
 - ◆ Power Limit by Compensation Cutback (Frequency Shift)
 - ◆ Overload Protection (OLP) with Programmable Shutdown Delay Time
 - ◆ Over–Temperature Protection (OTP)
- Programmable Dead Times for Primary Side Switches and Secondary Side Synchronous Rectifiers
- VDD Under–Voltage Lockout (UVLO)
- Wide Operating Temperature Range –40°C to +125°C
- Automotive Qualification

SCHEMATICS AND CIRCUIT DESCRIPTION

The system diagram is on Figure 2. The key elements of the OBC are marked in the color blocks.

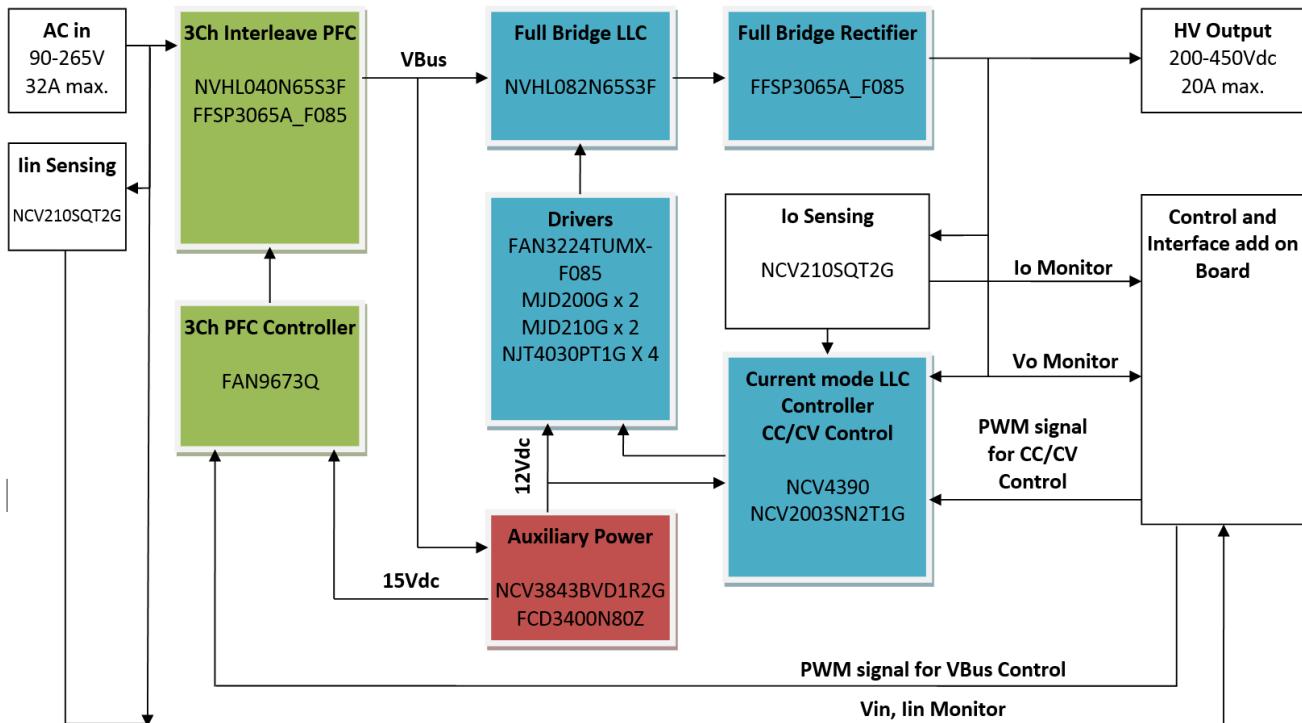

Figure 2. System Diagram of the 6.6 kW OBC

Following the AC input is the PFC stage. It's marked in light green. The detail schematic is shown on Figure 2. The key elements of the PFC stage are the controller FAN9673 and the triple boost power devices. They are in the right hand of the Figure 2. More details of the FAN9673 please refer the datasheet and the application notes of the device on the web site <https://www.onsemi.com/PowerSolutions/product.do?id=FAN9673>. Among others, to avoid the CS+ signals are short circuit equivalent by C48, C49 and C50, we placed the decouple inductors L21, L31 and L41 on the Vcc of the Totem poles. The PFC inductors and the Bridge rectifier locate out of the PCB and are mounted on the heatsink directly for better thermal control.

U10 is the input current sensing amplifier. It is a 200X fix-gain current sense amplifier. Co-operate with the R7

and R8, the voltage on pin6 of U10 will be $200 \times 0.001 \times I_{in}$. If $I_{in} = 32$ Arms, at peak point of the sin wave, the output of U10 is 9.0496 V.

The bus voltage is adjustable by the duty of the PWM signal BSPWM. This function allow the system designer optima the system efficiency according to the input and output condition. For example, if $V_{in} = 220$ ac, $V_o = 250$ Vdc. PF_{CO} set to 330Vdc will get higher efficiency in both of PFC and LLC stage than set to 390Vdc. The adjusting range is: When duty = 100%, the PF_{CO} = $2.5 \times [R_{24}+R_{25}+(R_{14}+R_{15})//R_{26}] / [(R_{14}+R_{15})//R_{26}] = 412.45$ Vdc. When the duty = 0%, the PF_{CO} = $2.5 \times (R_{24}+R_{25}+R_{26}) / R_{26} = 210.83$ Vdc.

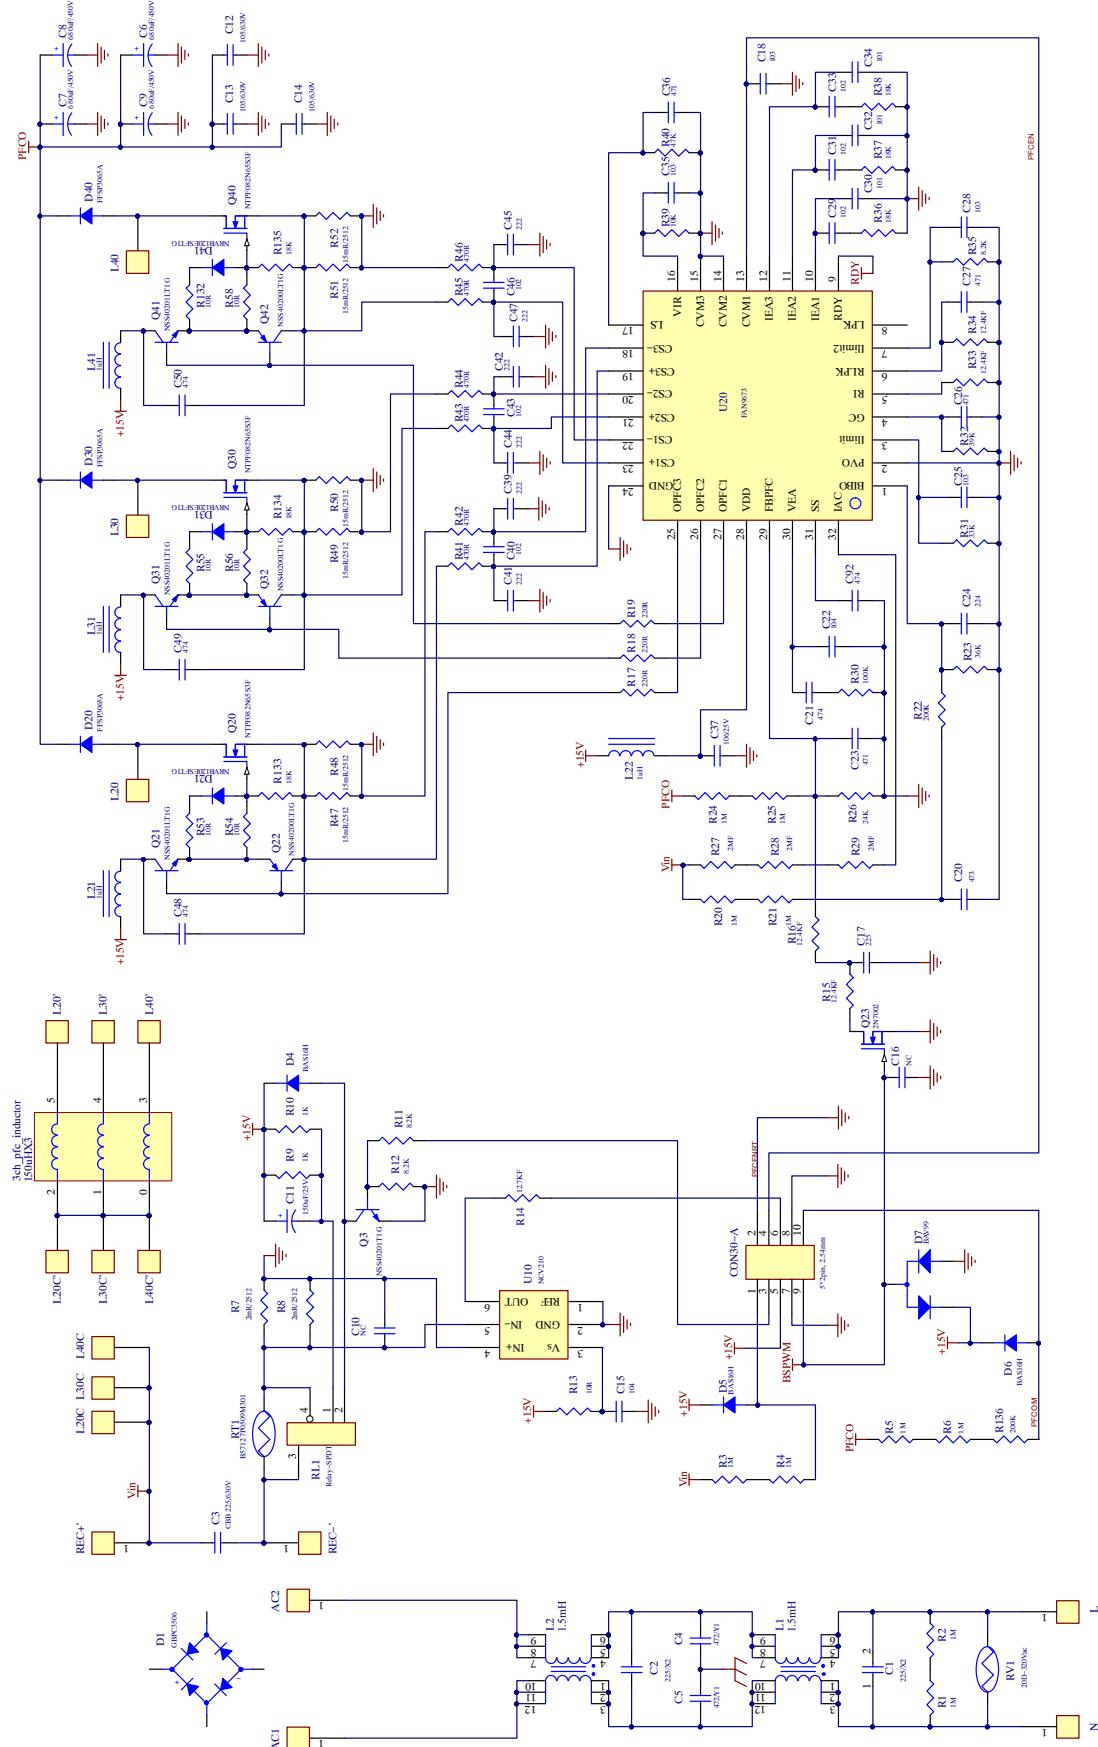

Figure 3. Schematic of the PFC

TND6320/D

The connector CON30-A connects the PFC stage to the interface board. The table 1 shows the signals.

Table 1. SIGNALS OF THE CON30-A

Pin No.	Direction	Description
1	Output	Input voltage sensing.
2	-	Return of PFC enable signal. Connect to GND of FAN9673 in differential path with Pin5.
3	Input	Relay Control signal.
4	Input	PFC enable signal. Control CM1 of FAN9673.
5	Output	+15V. Vcc of the circuits in primary side on the interface board.
6	Output	Input current sensing signal.
7	-	GND
8	-	GND
9	Input	BSPWM. PWM signal to control the bus voltage PFCO.
10	Output	PFC output voltage sensing.

Another key element of the OBC is the DCDC stage. It was marked in blue in Figure 2. The schematic of the DCDC stage is shown in Figure 4. We adopt the single full bridge LLC topology to get the high efficiency and suitable cost. It composed by U60 and Q60, Q62, Q70, Q72 etc. The NCV4390DR2G (U60) is a current mode advanced LLC controller. It is a pin to pin compatible device of the FAN7688. If you cannot find the device on the website, you can refer the description of FAN7688. More details of the

part please refer the datasheet and the application notes. Because of the high output voltage (250 – 450 Vdc), the Synchronous Rectifier cannot help too much on the rectifier conduction loss. So we omitted the SR function of the NCV4390DR2G. The transformer with integrated resonate inductor (please refer the datasheet of the transformer at below) and the resonate capacitor are glued on the aluminum box for better heat sink.

TND6320/D

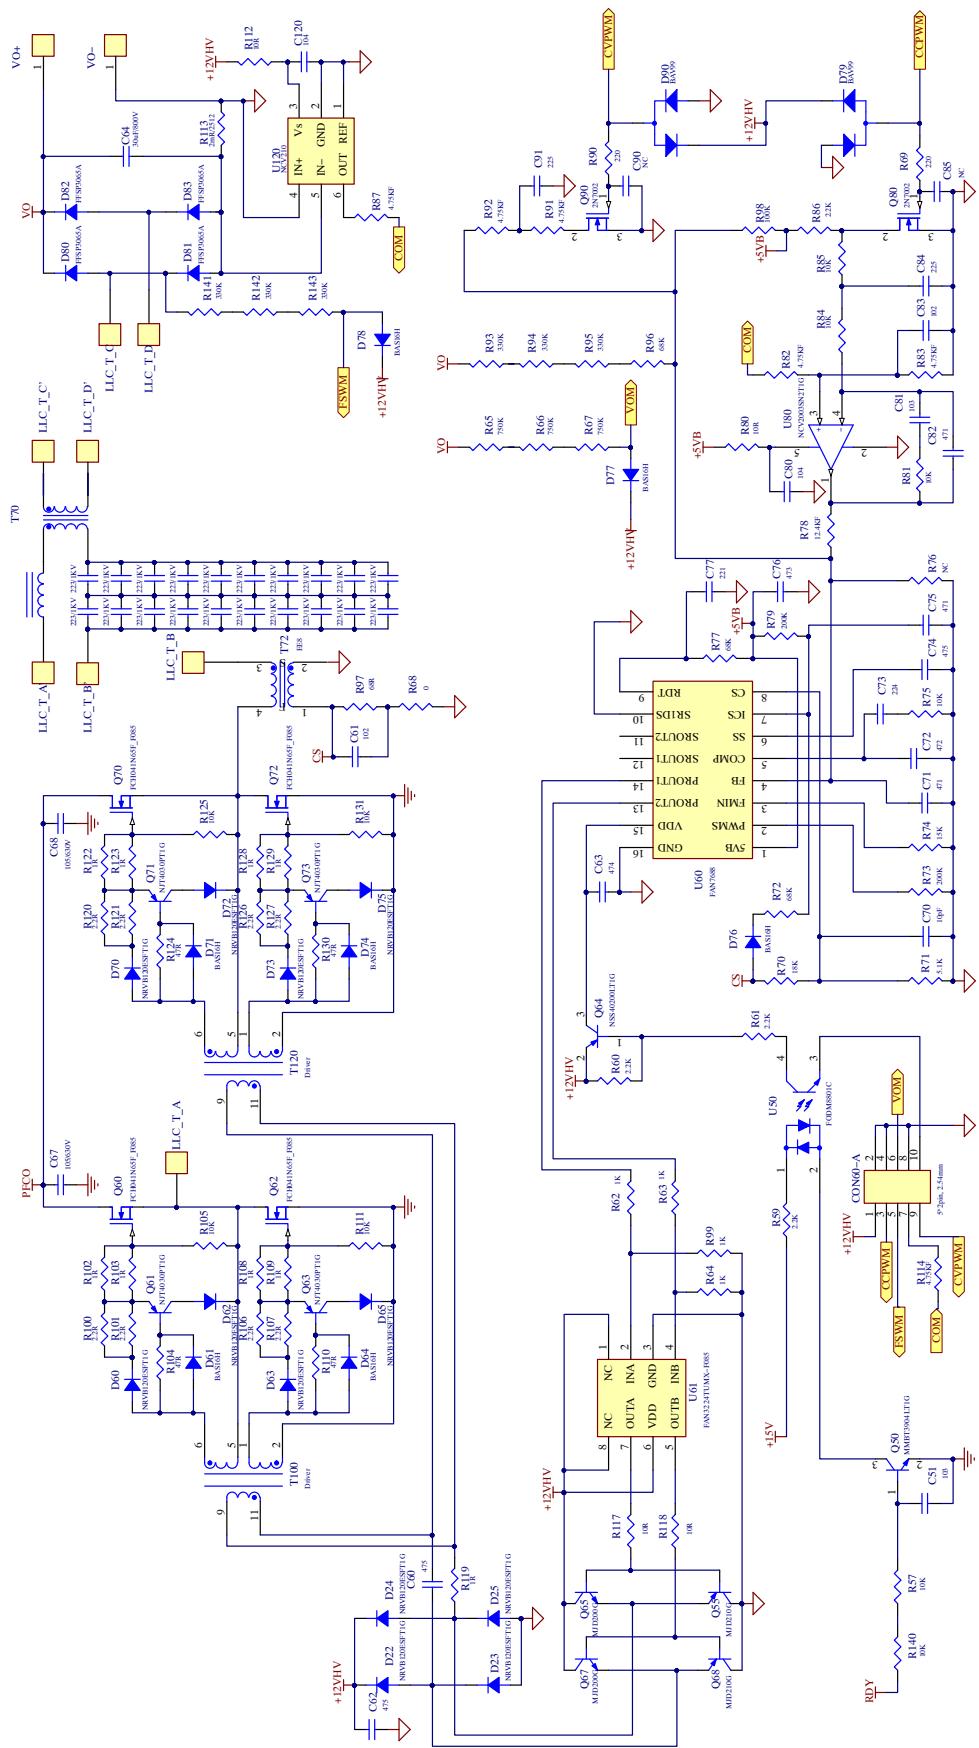

Figure 4. Schematic of the DCDC

CN60 is the interface of the DCDC stage. The Table 2 shows the signals on the CON60.

The NCV4390DR2G get VDD when both of the PFC RDY and the LLC enable signal are active.

Table 2. SIGNALS OF THE CON60

Pin No.	Direction	Description
1	Output	+12VHV.
2	-	GND
3	Input	CCPWM. PWM signal for constant current setting.
4	-	GND
5	Output	FSWM. Signal for switching frequency measurement.
6	Output	VOM. Output voltage sensing.
7	Output	COM. Output current sensing.
8	-	GND
9	Input	CVPWM. PWM signal for content voltage setting.
10	Input	LLC enable signal.

Except the main stages of PFC and DCDC, we also need an auxiliary power on the OBC to supply the Vcc/Vdd to the

controller and driver circuits. Figure 5 shows the schematic of the auxiliary power of this reference design.

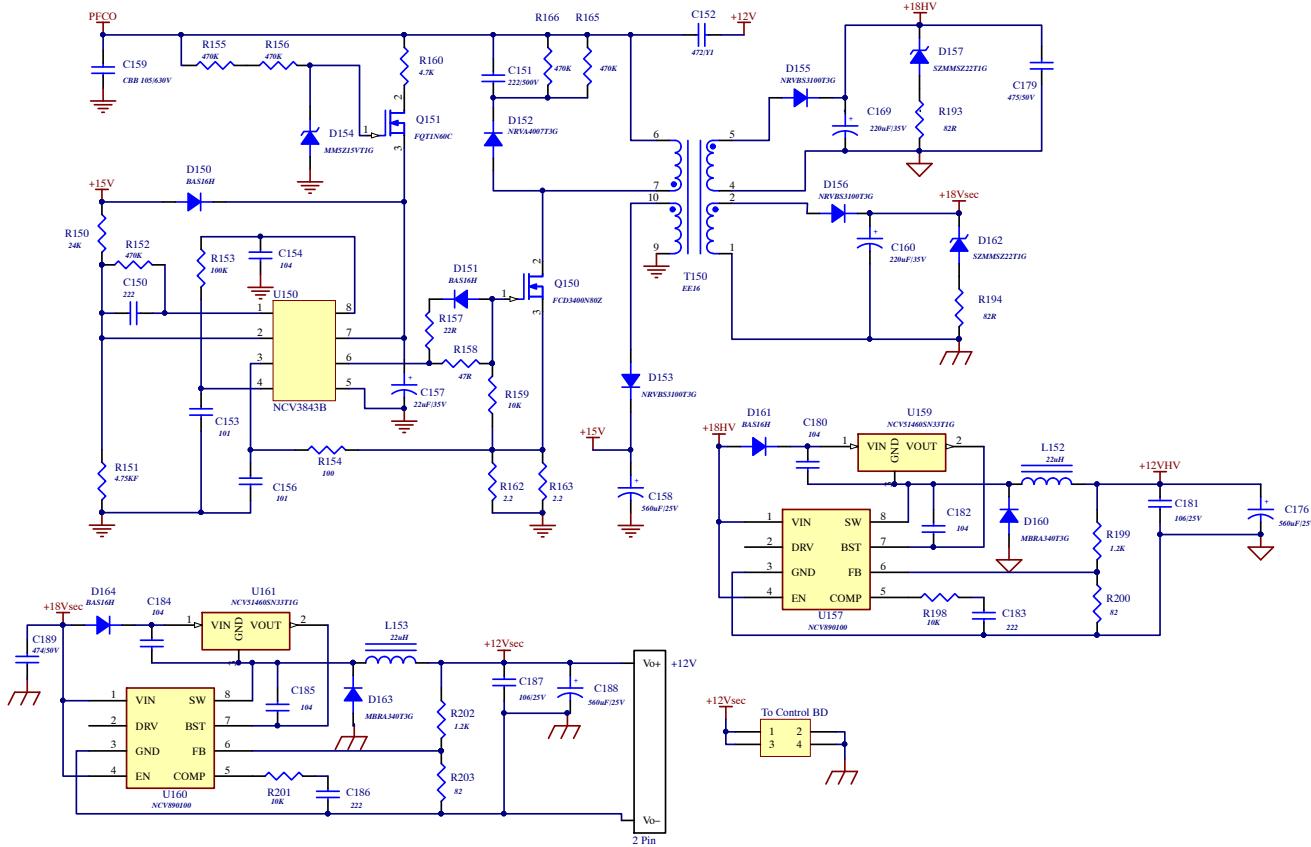

Figure 5. Schematic of the Auxiliary Power

The main topology of the auxiliary power is the fly-back which controlled by the AEC qualified PWM controller NCV3843BVD1R2G. The detail of the device please refer the datasheet on the web site: <https://www.onsemi.cn/pub/Collateral/NCV3843BV-D.PDF>

This OBC has 3 separate GNDs. They are primary GND, Secondary GND, and HV GND. These GNDs are isolating each other. The auxiliary power supplies 3 insulating outputs according to the 3 separate GNDs. The +15V output powers of the PFC controller, PFC MOSFETs driver and the Relay; the +12Vsec powers the circuits on the control board and the

off-board devices such as cooling FANs; the +12VHV powers the LLC controller and drivers. The controller of the auxiliary power feedback the output of the primary side +15V to save the optical coupler. Then the outputs of the secondary side and HV side will not be regulate due to the cross-regulation phenomena. So we inserted 2 Buck mode DCDC to the transformer outputs and the Loads. They are achieved by two pieces of NCV890100PDR2G. This device is a non-SR buck switching regulator with SO8-EP package. The switching frequency is up to 2 MHz. The performance cost ratio is high and easy for application.

On the typical application circuit of NCV890100, the Bootstrap is powered by the internal 3.3V regulator. This method has a problem on this OBC design. In case of the load of +15V is very light, the voltage of 18Vsec and +18VHV will drop and close to +12Vsec and +12VHV. The off-period of the buck converter will be very small. Then the bootstrap cap has no enough time to be charged. The voltage of the BST pins will drop below the DRV POR Stop Threshold and the device stop working. To save this problem we connect the bootstrap diodes (D161, D164) to Vin of the buck converters instead of the DRV pin. And insert a 3.3V LDO (U159, U161) from the bootstrap voltage to BST pin.

This way extends the maxima duty range of the converter. And if the device stops working by Vin drop, once the Vin-Vo goes up to 3.3V, the device will re-work again. But in the typical application circuit, if the device stops working, it will keep stop until the Vo drop to 0V.

In this design, we put the interface circuits on an add-on board for the flexibility. The features of the full function interface board could include the (1) Can communication with the BMS system to report the information like: Input voltage, Input current, Output voltage, Output current, Bus voltage, Output miss-connection, Temperature of the key components. (2) Can communication with the BMS to receive the following command: Power-up, Output voltage, Output current, Power off. (3) Output the CC, CV PWM signals and the power-on and relay-on signals to the main board. (4) Setting the Bus voltage according to the Vin, Vo and LLC switching frequency to get the maximum system efficiency. (5) Connect to Strata Developer Studio for evaluate the solution easily. But, the full function interface board is not ready so far. We use a simple manual control board instead of the full function one. Figure 6 shows the schematic of the manual control interface board.

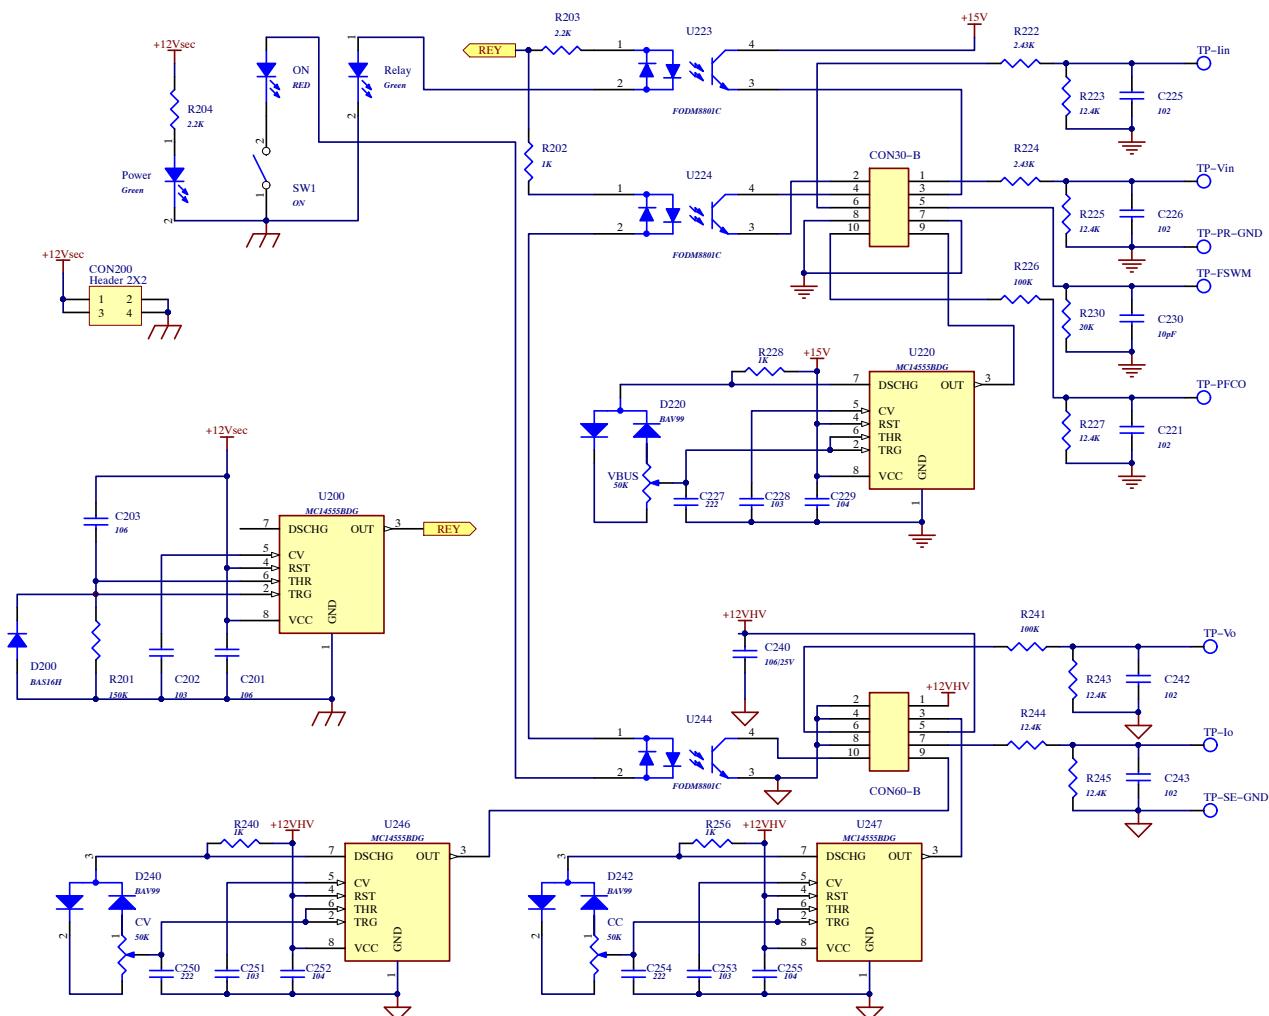

Figure 6. Schematic of the Manual Control Interface Board

TND6320/D

The SW1 powers ON/OFF the PFC and LLC stage in the secondary side for safety. It is delivery to the primary and HV stage by U224 and U244. The Vcc of the U223 and U224 is powered by the REY signal, thus the power-up will be AND with the relay active. The REY signal is 3 second delayed by U200 from the 12V LV active moment to guarantee the Bus Caps is full charged. The BSPWM, CC

and CV PWM signals are generated by the U220, U246 and U247 and the peripherals components. The variable resistors VBUS, CC and CV control the duty of the PWM signals. The sensing signals like Vin, Iin, Vbus, Vo and Io was connected to the test points for customer testing by the voltage meter.

Chip resister 0805 12.4Kohm-F		Any	6	R223, R225, R226, R243, R244, R245,
Chip resister 0805 20Kohm-J		Any	1	R230,
Chip resister 0805 100Kohm-J		Any	2	R226, R241,
Chip resister 0805 150Kohm-J		Any	1	R201,
Potentiometer 50Kohm 10X11mm Vertical		Any	3	CC, CV, VBUS,
MLCC 0805-50V-10pFK-NP0	885012007051	WURTH	1	C230,
MLCC 0805-50V-102M-X7R	885012207086	WURTH	5	C221, C225, C226, C242, C243,
MLCC 0805-100V-102M-NP0	CGA4C2C0G2A102J	TDK	5	C221, C225, C226, C242, C243,
MLCC 0805-50V-222M-X7R	885012207088	WURTH	3	C227, C250, C254,
MLCC 0805-50V-222J-NP0	CGA4C2C0G1H222J	TDK	3	C227, C250, C254,
MLCC 0805-50V-103M-X7R	885012207092	WURTH	4	C202, C228, C251, C253,
MLCC 0805-50V-103J-NP0	CGA4C2C0G1H103J	TDK	4	C202, C228, C251, C253,
MLCC 0805-25V-104M-X7R	885012207072	WURTH	3	C229, C252, C255,
MLCC 0805-100V-104K-X7R	CGA4J2X7R2A104K	TDK	3	C229, C252, C255,
MLCC 1206-25V-106M-X7R	885012208069	WURTH	3	C201, C203, C240,
MLCC 1206-25V-106K-X7R	CGA5L1X7R1E106K	TDK	3	C201, C203, C240,
Connector 2.54 mm THT Angled Dual Pin Header 10Pns	61300421021	WURTH	1	CON200,
Connector 2.54 mm THT Angled Dual Pin Header 10Pns	61301021021	WURTH	2	CON30, CON60,
Test Pin		Any	8	TP_PFCO, TP_IIN, TP_VIN, TP_FSWM, TP_GND_PR, TP_GND_HV, TP_IO, TP_VO,
Switch 1 Connector 2 Position, 8.6X4.4mm		Any	1	SW1,

ON Semiconductor owns the rights to a number of patents, trademarks, copyrights, trade secrets, and other intellectual property. A listing of ON Semiconductor's product/patent coverage may be accessed at www.onsemi.com/site/pdf/Patent_Marking.pdf. ON Semiconductor reserves the right to make changes without further notice to any products herein. ON Semiconductor makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does ON Semiconductor assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. Buyer is responsible for its products and applications using ON Semiconductor products, including compliance with all laws, regulations and safety requirements or standards, regardless of any support or applications information provided by ON Semiconductor. "Typical" parameters which may be provided in ON Semiconductor data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. ON Semiconductor does not convey any license under its patent rights nor the rights of others. ON Semiconductor products are not designed, intended, or authorized for use as a critical component in life support systems or any FDA Class 3 medical devices or medical devices with a same or similar classification in a foreign jurisdiction or any devices intended for implantation in the human body. Should Buyer purchase or use ON Semiconductor products for any such unintended or unauthorized application, Buyer shall indemnify and hold ON Semiconductor and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that ON Semiconductor was negligent regarding the design or manufacture of the part. ON Semiconductor is an Equal Opportunity/Affirmative Action Employer. This literature is subject to all applicable copyright laws and is not for resale in any manner.
